The House of Education,
Ambleside.

28 2. 1955

Sir

I am much interested in the account of the Macdonalds' experiment in Canada which appeared in the Times of Feb. 16. I venture to think that some particulars of a scheme which has been doing good work in England, for some twelve years, may be perhaps interesting & suggestive to those engaged in working the Macdonalds' Experiment.

We have a large number of children in England & the Colonies who are brought up in home-schoolrooms & who have therefore lacked many of the advantages of the school-brought child.

The problem was how to get these children educated in spite of the second-rate, untutored, ignorances which, with a few exceptions, were all that could be had some years ago.

The work of the Parents' Renew School has produced such results that we feel not only have we given the home-taught child all the advantage of one taught at school; but have placed him intellectually in a better position for any work which may come to him in after life.

We find that the secret of education is to bring children up upon books & things that the oral lesson or lecture is, when often used, deritalizing.

So much thought has, in the last few years, been given to bringing children up on things that what remains to be done away with the oral lesson is a principal

The House of Education,
Ambleside.

means of education fitting children
into child touch with books.

We find that the use of books - good living
books & many books - produces a habit
of intelligent attention which no amount
of oral teaching could do.

The children read (or learn to read) their own good, living,
books upon a considerable number of
subjects. One intelligent reading after
the kind of training referred to will
enable a child to tell in his own way -
a way that shows his own mind has
worked upon the matter - the episodes:
older children will find the points of

an argument, or the points recorded in a newspaper article on some special subject in the same intelligent way.

The children thus get ~~the~~ not only the power of reading but they ^{also} get into touch with the best thought past & present in the books set for study.

The work done by children brought up in this way (we have some hundreds of 20's during the year) shows in almost all cases intellectual grasp of the subjects studied "talk" "howlers" are rare. We have now several schools carrying out our programmes & examination papers successfully.

The House of Education,
Ambleside.

This sort of work would seem to be available in Canada when the parents can afford the necessary books but, when there are not enough children to make it possible to work a good school, peripatetic teachers (visiting small schools for nature work & handicrafts) might work half-a-dozen such little schools - each of them under one or two intelligent, but not highly-qualified teachers.

In fact the conditions seem to me much the same as those existing in our upper classes in County districts in England when two or three families often unite under one person.

I must beg you to pardon this suggestion if it does not meet the case.

- 2/10/1937
- for your consideration
- Dear sending you, under another covr.
- I The P.M.U. Report (of which the P.R.S. is an outcome.)
 - II a pamphlet written after 12 yr experience of his son of work.
 - III The time-table programmes for the curriculum.
 - IV The programmes for East term.
 - V The prospectus of the Parents' Review School for families (6) in schools.

Yours, Sir,

Truly yours

Charlotte M. Mason
